

Scientists need to back up their opinions with research and data that survive the peer-review process. The preponderance of current published evidence points toward human contributions to global climate change. That consensus position is also the position of the Academies of Science from 80 countries around the world.

- 1 What do you think of the video? As a group critique it.
- 2 Could the consensus position be wrong?
- 3 Do you agree or disagree with the consensus position?
