

Introduction to Worksheet

The worksheet linked to the main page can be used in classrooms as a brief introduction to certain test statistics. The data in the worksheet came from the articles written by Hrabowski. This gives real life application to ideas that may sometimes seem meaningless.

No prior statistical knowledge is needed to calculate the test statistic numbers. The formulas are included as well as identification of what each variable stands for. However, to understand the meaning of the numbers, one may need an explanation of the tests used. Those explanations can be found by going to the math survey link.
