

Reflections

I found the RSA History most interesting; especially the recent information about who actually discovered public key cryptography first. I think it would have been very hard for the GCHQ to sit by and watch public key cryptography be “invented” when they had done the exact same thing several years before. Because of oaths that were taken to the British Government, the information regarding cryptography could not be released. Since this information has just recently been discovered, only one of my sources included it. I found this the most amazing and unexpected detail of the entire project.
